Definition. Let G be a group, $\phi: G \to G$ be an injective endomorphism.

Definition. Let G be a group, $\phi: G \to G$ be an injective endomorphism. The group

$$\mathsf{HNN}_{\phi}(G) = \langle G, t \mid tat^{-1} = \phi(a), a \in G \rangle$$

is called an ascending HNN extension of G or the mapping torus of ϕ .

5990

Definition. Let G be a group, $\phi: G \rightarrow G$ be an injective endomorphism. The group

 $\mathsf{HNN}_{\phi}(G) = \langle G, t \mid tat^{-1} = \phi(a), a \in G \rangle$

is called an *ascending HNN extension* of *G* or the *mapping torus* of ϕ . **Example.** $\langle x, y, t | txt^{-1} = xy, tyt^{-1} = yx \rangle$.

Definition. Let G be a group, $\phi: G \to G$ be an injective endomorphism. The group

$$\mathsf{HNN}_{\phi}(\mathsf{G}) = \langle \mathsf{G}, \mathsf{t} \mid \mathsf{tat}^{-1} = \phi(\mathsf{a}), \mathsf{a} \in \mathsf{G} \rangle$$

is called an *ascending HNN extension* of *G* or the *mapping torus* of ϕ . **Example.** $\langle x, y, t | txt^{-1} = xy, tyt^{-1} = yx \rangle$.

Definition. Let G be a group, $\phi: G \rightarrow G$ be an injective endomorphism. The group

Fact 1. (Gromov-Olshanskii) Almost every 1-related group is hyperbolic. Almost every mapping torus of the free group is hyperbolic.

Fact 2. (S., Schupp) 99.6% of all 1-related group are mapping tori or free group endomorphisms.

Sac

Fact 1. (Gromov-Olshanskii) Almost every 1-related group is hyperbolic. Almost every mapping torus of the free group is hyperbolic.

Fact 2. (S., Schupp) 99.6% of all 1-related group are mapping tori or free group endomorphisms.

<ロ> < 同> < 同> < 三> < 三> < 三> 三 の < ()

Example (Magnus procedure). Consider the group $\langle a, b \mid aba^{-1}b^{-1}aba^{-1}b^{-1}a^{-1}b^{-1}a = 1 \rangle$.

Fact 1. (Gromov-Olshanskii) Almost every 1-related group is hyperbolic. Almost every mapping torus of the free group is hyperbolic.

Fact 2. (S., Schupp) 99.6% of all 1-related group are mapping tori or free group endomorphisms.

Example (Magnus procedure). Consider the group $\langle a, b \mid aba^{-1} \cdot b^{-1} \cdot aba^{-1} \cdot b^{-1} \cdot a^{-1}b^{-1}a = 1 \rangle$. Replace a^iba^{-i} by b_i .

(ロ) (用) (三) (三) (三) (の)

Fact 1. (Gromov-Olshanskii) Almost every 1-related group is hyperbolic. Almost every mapping torus of the free group is hyperbolic.

Fact 2. (S., Schupp) 99.6% of all 1-related group are mapping tori or free group endomorphisms.

Example (Magnus procedure). Consider the group $\langle a, b_{-1}, b_0, b_1 | b_1 b_0^{-1} b_1 b_0^{-1} b_{-1}^{-1} = 1, a^{-1} b_0 a = b_{-1}, a^{-1} b_1 a = b_0 \rangle$. So we have a new presentation of the same group.

Fact 1. (Gromov-Olshanskii) Almost every 1-related group is hyperbolic. Almost every mapping torus of the free group is hyperbolic.

Fact 2. (S., Schupp) 99.6% of all 1-related group are mapping tori or free group endomorphisms.

Example (Magnus procedure). Consider the group $\langle a, b_{-1}, b_0, b_1 | b_1 b_0^{-1} b_1 b_0^{-1} b_{-1}^{-1} = 1, a^{-1} b_0 a = b_{-1}, a^{-1} b_1 a = b_0 \rangle$. Note that b_{-1} appears only once in $b_1 b_0^{-1} b_1 b_0^{-1} b_{-1}^{-1} = 1$.

Fact 1. (Gromov-Olshanskii) Almost every 1-related group is hyperbolic. Almost every mapping torus of the free group is hyperbolic.

Fact 2. (S., Schupp) 99.6% of all 1-related group are mapping tori or free group endomorphisms.

Example (Magnus procedure). Consider the group $\langle a, b_{-1}, b_0, b_1 | b_1 b_0^{-1} b_1 b_0^{-1} b_{-1}^{-1} = 1, a^{-1} b_0 a = b_{-1}, a^{-1} b_1 a = b_0 \rangle$. So we can replace b_{-1} by $b_1 b_0^{-1} b_1 b_0^{-1}$, remove this generator, and get a new presentation of the same group.

Fact 1. (Gromov-Olshanskii) Almost every 1-related group is hyperbolic. Almost every mapping torus of the free group is hyperbolic.

Fact 2. (S., Schupp) 99.6% of all 1-related group are mapping tori or free group endomorphisms.

Example (Magnus procedure). Consider the group $\langle a, b_0, b_1 \mid a^{-1}b_0a = b_1b_0^{-1}b_1b_0^{-1}$, $a^{-1}b_1a = a_0 \rangle$. This is clearly an ascending HNN extension of the free group $\langle b_0, b_1 \rangle$.

So if G is residually finite then for every $w(x, y) \neq 1$, we found a finite group V and a periodic point (\bar{x}, \bar{y}) of the map

$$ilde{\phi}$$
: (a, b) \mapsto (ϕ (a), ϕ (b))

on $V \times V$ such that

$$w(\bar{x},\bar{y}) \neq 1.$$

So the periodic point should be outside the "subvariety" given by w = 1.

(ロ) (用) (三) (三) (三) (の)

So if G is residually finite then for every $w(x, y) \neq 1$, we found a finite group V and a periodic point (\bar{x}, \bar{y}) of the map

$$ilde{\phi}$$
: (a, b) \mapsto (ϕ (a), ϕ (b))

So the periodic point should be outside the "subvariety" given by w = 1.

(ロ) (同) (三) (三) (三) (0) (0)

Key observation. The converse statement is also true (the number of generators and the choice of ϕ do not matter).

Thus in order to prove that the group $HNN_{\phi}(F_k)$ is residually finite,

Thus in order to prove that the group $HNN_{\phi}(F_k)$ is residually finite, we need,

Thus in order to prove that the group $\text{HNN}_{\phi}(F_k)$ is residually finite, we need, for every word $w \neq 1$ in F_k ,

Thus in order to prove that the group $\text{HNN}_{\phi}(F_k)$ is residually finite, we need, for every word $w \neq 1$ in F_k , find a finite group G

〈曰〉〈曰〉〈己〉〈之〉〈之〉

The idea

Thus in order to prove that the group $\text{HNN}_{\phi}(F_k)$ is residually finite, we need, for every word $w \neq 1$ in F_k , find a finite group G and a periodic point of the map $\tilde{\phi} \colon G^k \to G^k$

5990

The idea

Thus in order to prove that the group $\text{HNN}_{\phi}(F_k)$ is residually finite, we need, for every word $w \neq 1$ in F_k , find a finite group G and a periodic point of the map $\tilde{\phi} \colon G^k \to G^k$ outside the "subvariety" given by the equation w = 1.

Deligne conjecture, proved by Fujiwara and Pink:

Fixed points are not enough.

Example: $x \mapsto x + 1$ does not have fixed points.

Deligne: instead of fixed points, P(x) = x, consider quasi-fixed points, $P(x) = x^{p^n} (= Fr^n(x))$.

Note that all quasi-fixed points are periodic because Fr is the automorphism of finite order, and commutes with P since all coefficients of P are integers.

Deligne conjecture, proved by Fujiwara and Pink: If *P* is dominant and quasi-finite
